Subject: Re: Air Monitoring (mobile)

Hi Mike. In the area that CPG is dredging, there is an occasional report of an oil-like scent. We made sure that all of the air meters were operating (all the real time monitors were) and checked their readings. There was no alarm triggered by any of these meters yesterday or even through today. We also made sure that the closest PUF sampler began to take a PCB sample.

Though no alarm was triggered, I have asked and will let you know if there was any blip, even a slight one on the VOC/H2S monitors as soon as I get the history from yesterday.

It should be noted that the dredge is currently operating in the location of a former marina, so there are pilings, sunken boats (pieces of an aluminum hull extracted this morning), and other remnants of a former era that are likely the cause for the occasional petroleum whiffs being detected such as when the aluminum (think it was aluminum row boat) was being pulled.

Stan,

CDM reported odors yesterday and mentioned that corrective measures were made.

What were those measures and did any readings, however slight, get recorded by the air monitors (VOC/H2S primarily)?

Mike

We should put it out anyway. EPA is monitoring that we have all monitors deployed. As Mike says, put it in the park if we already have a unit near and downwind of the dredge unit.

We originally didn't put the mobile air unit out because the location would be adjacent to the weather station where we already have monitoring...so it's not clear if we need this redundant unit.
